

Indicators are substances which indicate the acidic or basic nature of the solution by their colour change.

Type of Indicators

Natural Indicators

Litmus
Turmeric
Red Cabbage

Synthetic Indicator

Methyl orange
Phenolphthalein

Olfactory Indicator

Onion
Vanilla
Clove Oil

MIND MAPS

ANJIT ACADEMY

S. No.	Indicators	pH range	Colour in Original Colour	Colour in Acidic medium	Colour in Basic medium
1.	Litmus paper	4.5 - 8.3	purple	Red	Blue
2.	Methyl Orange	3.2 - 4.4	Orange	Red	Yellow
3.	Phenolphthalein	8.2 - 10.0	Colourless	Colourless	Pink
4.	Methyl red	4.8 - 6.0		Yellow	Red

Bases are classified On the basis of -

Strength

Strong bases
Weak bases

Concentration

Dilute bases
Concentrated bases

Physical Properties of Bases

Bitter in taste
Turns red litmus blue
Give OH⁻ ions in aqueous solution
Does not conduct electricity

Chemical Properties of Bases

Alkali reacts with metal to liberate hydrogen
 $2\text{NaOH} + \text{Zn} \rightarrow \text{Na}_2\text{ZnO}_2 + \text{H}_2 \uparrow$
Bases reacts with acidic oxides to form salts.
 $2\text{NaOH} + \text{CO}_2 \rightarrow \text{Na}_2\text{CO}_3 + \text{H}_2\text{O}$

Physical Properties of Acids

Sour in taste
Turns blue litmus red
Give H⁺ ions in aqueous solution
Aqueous solution conduct electricity

Acids, Bases and Salts

Chemical Properties of Acids

Reacts with metals to liberate hydrogen.
 $\text{Acid} + \text{Metal} \rightarrow \text{Salt} + \text{Hydrogen Gas}$
 $2\text{HCl} + \text{Zn} \rightarrow \text{ZnCl}_2 + \text{H}_2 \uparrow$
Reacts with metal carbonates/metal hydrogen carbonate to liberate CO₂
 $2\text{HCl} + \text{Na}_2\text{CO}_3 \rightarrow 2\text{NaCl} + \text{CO}_2 + \text{H}_2\text{O}$
 $\text{HCl} + \text{NaHCO}_3 \rightarrow \text{NaCl} + \text{CO}_2 + \text{H}_2\text{O}$

Salts

When acid and base are combined under the given condition, Salt is obtained

Types of salts

Common salt: $\text{NaOH} + \text{HCl} \rightarrow \text{NaCl} + \text{H}_2\text{O}$
Bleaching Powder: $\text{Ca(OH)}_2 + \text{Cl}_2 \rightarrow \text{CaOCl}_2 + \text{H}_2\text{O}$
Baking Soda: $\text{NaCl} + \text{H}_2\text{O} + \text{CO}_2 + \text{NH}_3 \rightarrow \text{NH}_4\text{Cl} + \text{NaHCO}_3$
Washing Soda: $\text{Na}_2\text{CO}_3 + 10\text{H}_2\text{O} \rightarrow \text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$
Plaster of Paris: $\text{CaSO}_4 \cdot 2\text{H}_2\text{O} \rightarrow \text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O} + 1\frac{1}{2}\text{H}_2\text{O}$
Gypsum: $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O} + 1\frac{1}{2}\text{H}_2\text{O} \rightarrow \text{CaSO}_4 \cdot 2\text{H}_2\text{O}$

Uses:

- pH of a soil
- pH in tooth decay
- pH in the digestive system

PH of a Solution is the magnitude of the negative power to which 10 must be raised to express the hydrogen ion concentration of the solution in moles per litre.

$$\text{i.e. } [\text{H}^+] = 10^{-x} \Rightarrow \text{PH} = x \Rightarrow \text{pH} = -\log_{10}[\text{H}^+]$$

$$\text{pH} = 7 \text{ Neutral Solution } \text{H}_3\text{O}^+ = \text{OH}^-$$

$$\text{pH} > 7 \text{ Basic Solution } \text{H}_3\text{O}^+ < \text{OH}^-$$

$$\text{pH} < 7 \text{ Acidic Solution } \text{H}_3\text{O}^+ > \text{OH}^-$$

$$\Rightarrow K_w = [\text{H}^+] \times [\text{OH}^-] = 10^{-14} \text{ at } 25^\circ\text{C} (298 \text{ K})$$
